

1. The three basic technologies needed to run a website are web hosting, web design, and a domain name.
2. What are local files, web servers, and FTP, and how are they all related?
Local Files are the files or web pages you would upload to your website to publish on the web server. Web Servers are where people would publish their websites in order for the public to view their site. FTP (File Transfer Protocol) is the process you would use to transfer files. Web servers, FTP and local files all work together in the process of building websites and publishing them to the World Wide Web. Local files are uploaded to the web server using File Transfer Protocol (FTP).
3. AFS space allows you to have a platform through which you can upload your web pages to your website.
4. The URL for the AFS space MSU provides to us is
<http://www.msu.edu/~netID>
